

How to connect the underground access switch

AI Overview

Connecting an underground access switch requires proper cabling, grounding, and adherence to safety standards to ensure reliable network or electrical operation.

Step 1: Plan the Installation Before connecting the switch, determine the location, cable routes, and power requirements. For network switches, ensure the switch is on the same LAN segment or VLAN as the devices it will serve, and verify whether it requires PoE+ or PoE++ for connected devices. For electrical underground switches, confirm the switchgear is rated for the intended voltage and load, and review the manufacturer's installation manual.

Step 2: Prepare the Trench or Conduit For underground installations, dig a trench at least 18 inches deep or below the frost line for direct-burial cables. Use PVC or metal conduit if required by local codes, and ensure the conduit diameter allows for easy cable pulling without overfilling. For electrical switchgear, follow the manufacturer's guidelines for cable support brackets and anchor-bolt placement.

Step 3: Cable Connections **Network Switches:** Use Ethernet cables to connect devices to the switch ports. For PoE devices, connect to the designated PoE ports. Ensure proper labeling and verify that each device is powered and connected correctly. **Electrical Switchgear:** Connect load-interrupter switches or fault-interrupter positions according to the wiring diagram. Bond the ground wire to the system neutral or local earth ground. Confirm all connections are tight and secure before energizing.

Step 4: Grounding and Safety Proper grounding is critical. For network switches, ensure the chassis is grounded if required. For electrical underground switches, bond the enclosure to the earth ground and verify that all bushings and components are de-energized before touching. Always wear personal protective equipment such as gloves, mats, and arc-flash clothing when w...
