

Indoor Fiber Optic Eight-Core Single-Mode

AI Overview

Indoor 8-core single-mode fiber optic cables are designed for high-speed, long-distance data transmission within buildings, featuring tight-buffered fibers and LSZH jackets for safety and flexibility.

Cable Construction and Specifications

An 8-core single-mode indoor fiber optic cable typically contains eight individual fibers, each with a 9 μm core diameter and 125 μm cladding, optimized for long-distance, high-bandwidth transmission. The fibers are coated with a UV-curable acrylate primary protective layer and reinforced with multi-strand aramid yarn for tensile strength. The cable is usually tight-buffered, meaning each fiber is individually coated and protected, which simplifies handling, splicing, and termination in indoor environments. The outer jacket is commonly made of LSZH (Low Smoke Zero Halogen) material, which is fire-retardant and emits minimal smoke and toxic gases in case of fire, making it suitable for indoor installations in offices, data centers, and telecom rooms. Typical cable dimensions include an outer diameter around 5.3 mm and a lightweight design for easy routing through conduits or cable trays.

Key Features

- Core Count:** 8 fibers, individually color-coded for easy identification.
- Fiber Type:** Single-mode (OS2), suitable for long-distance, high-speed data transmission.
- Jacket Material:** LSZH for indoor safety compliance.
- Tensile Strength:** Reinforced with aramid yarn for durability.
- Flexibility:** Soft, small-diameter, and easy to peel for installation.
- Electromagnetic Immunity:** Non-conductive, immune to EMI and lightning interference.

Applications

Indoor 8-core single-mode fiber optic cables are ideal for:

- Data centers and server rooms for connecting switches, routers, and patch panels.
- Telecommunications rooms and office buildings for backbone cabling.
- High-speed network installations requiring long-distance signal transmission without rep...
