

Inquiry about cabinet and rack armor

AI Overview

Cabinet and rack armor provides physical security and monitoring for server racks, combining access control, alarms, and reporting to protect sensitive data. Overview of Rack Armor Rack armor solutions are designed to secure server cabinets and racks against unauthorized access and internal breaches. Unlike traditional physical security that focuses on building perimeters, rack armor protects the cabinet level, ensuring that only authorized personnel can access servers and sensitive equipment . These systems are particularly important for organizations with multiple data centers or remote sites. Key Features 1. Access Control: Rack armor integrates proximity card readers and electronic locks on both front and back doors of server cabinets. Access can be restricted to specific personnel and scheduled for certain times . 2. Monitoring and Alerts: The system tracks who accessed a rack, when, and for how long, providing real-time notifications via email, alarms, or video alerts if a cabinet is unsecured . 3. Software Integration: Rack armor is powered by software such as PremiSys, which allows administrators to configure cabinets, assign access groups, and monitor events through a dynamic site map. This software can also generate customized audit reports for compliance and security auditing . 4. Alarm Management: Events like unauthorized access or door openings trigger alarms. Administrators can acknowledge alarms, lock or unlock doors remotely, and view the status of all racks across multiple locations . 5. Physical Protection: Some rack armor products include ballistics-grade HDPE upright protectors and barriers, which provide additional physical protection against impacts or accidental damage to racks . Installation and Configuration Hardware is mounted on the outside of the cabinet doors, integrating card readers with electronic locks and handles . Cabinets are configured in the software to associate front and back readers, relays, and inputs, creating a virtual representation of each rack for monitoring . Access groups are assi...
