

## Lighting Cable

### AI Overview

A lighting cable is an electrical cable designed to safely deliver power or control signals to lighting equipment, either as fixed wiring or flexible supply leads. What is a Lighting Cable? A lighting cable is used to provide electricity to lighting fixtures such as lamps, ceiling lights, LED systems, floodlights, and stage lighting. It forms part of a broader electrical system, ensuring reliable power delivery and safe operation across a range of voltages. Lighting cables can carry power, control signals, or both, depending on the installation requirements.

**Types of Lighting Cables**

**Fixed Lighting Cable:** Used in permanent installations, running through walls or ceilings to connect the consumer unit to light fittings. Typically, a 1mm<sup>2</sup> twin and earth cable is used for domestic lighting circuits, capable of handling up to 12 amps and powering up to 12 x 100W bulbs per circuit.

**Flex Cable:** A flexible cable used for portable or adjustable lighting fixtures. It usually contains tinned copper strands for flexibility and durability, with 2-3 cores insulated in PVC and an outer protective sheath.

**Construction and Safety**

Lighting cables consist of multiple cores: live, neutral, and earth. Each core is insulated with color-coded PVC for identification, and the earth conductor is often sleeved in green and yellow. The cores are enclosed in an outer PVC sheath for protection. Proper sizing and installation are critical to prevent overheating, energy loss, or fire hazards.

**Applications**

**Domestic Lighting:** Ceiling roses, wall lights, and multi-switch setups. Circuits are often split to prevent total darkness if a fuse blows.

**Commercial and Industrial Lighting:** Custom cables may include reinforced materials or shielding to withstand environmental conditions and ensure reliable performance.

**Portable Lighting:** Flex cables supply power to movable lamps or stage lighting, allowing repeated bending without damage.

**Key Considerations**

Always use the correct cable size for the circuit length and load to avoid overheating. Fixed lighting cables are generally routed through walls or conduits, while flex cables are used ext...
