

National Optical Cable Output Value in 2020

AI Overview

The national optical cable output in China for 2020 was approximately 250 million core kilometers. In 2020, China's optical cable production experienced fluctuations due to the COVID-19 pandemic and subsequent recovery. By June 2020, the cumulative output reached 132.261 million core kilometers, reflecting a 6.3% increase compared to the same period in the previous year, despite a temporary decline in early months due to delayed production resumption caused by the epidemic. Monthly production in April 2020 was 26.731 million core kilometers, showing a 43.8% year-on-year increase as manufacturing resumed and demand for 5G infrastructure accelerated. By July 2020, cumulative output had grown to 158.582 million core kilometers, maintaining a steady upward trend. The overall annual demand for optical cables in China was estimated at 250 million core kilometers, driven largely by the rapid deployment of 5G networks and data centers, which significantly boosted infrastructure requirements. The pandemic initially slowed production, but the combination of government support, new infrastructure projects, and the resumption of manufacturing enabled the industry to recover and achieve substantial output by the end of the year. This output reflects China's position as the largest producer of optical cables globally, with production closely tied to telecommunications expansion, particularly in the context of 5G rollout and digital infrastructure development.
